

EXACTCURE

Your Digital Twin for a Personalized Medication

Company Purpose

ExactCure develops a solution to **personalize medications** and **properly use drugs**

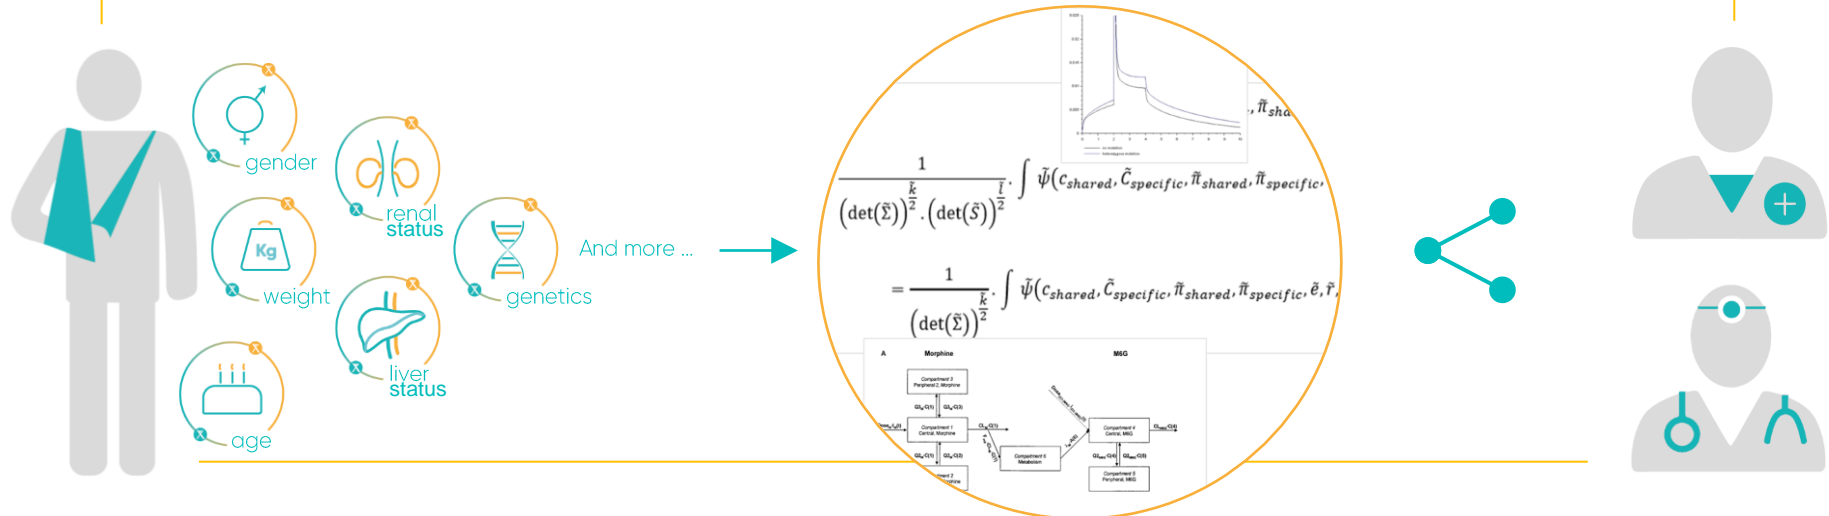

Problem: Medication Errors

A **lack of personalization** is involved in **36% of medication errors**

Solution : Personalized *in silico* drug modeling

A *Digital Twin* to simulate the **concentration of medicines** in the blood of patients, and their **effects, based on personal characteristics** (weight, renal status, DNA...)

Pharmacokinetic / Pharmacodynamic
Personalized PK/PD simulations

How? Proven Disruptive Technology

1

Proprietary **NLP** to mine the literature

2

Mathematically **aggregate** qualified models

Best model in the world
by EXACTCURE.

Value Proposition

CE

**Personalized Drug
Simulations as a Service**

**Call our API to integrate
simulations into your
platform**

ExactCure

API

- Medicine Information Providers
- Pharmaceutical companies
- Health insurance companies

ExactCure's customers

Provide Personalized Drug Simulations

- ✓ **Enrich drug information quality**
- ✓ **Reduce costs**
- ✓ **Improve image**
- ✓ **Gain market share**
- ✓ **Get Real World Evidence**

Healthcare Professionals

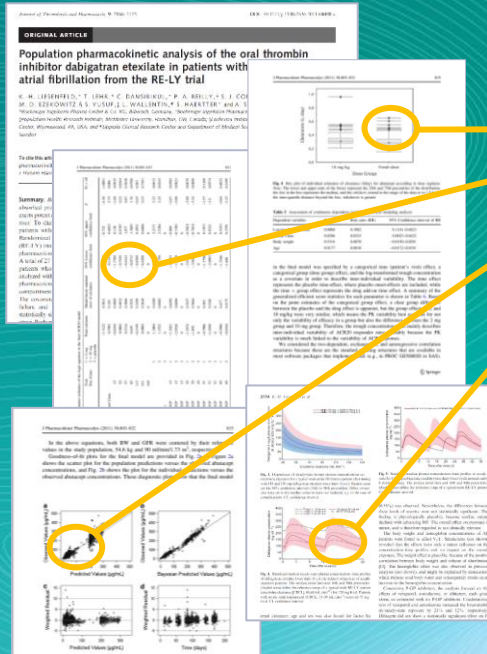

Patients

Run personalized drug simulations on demand to adapt posology, avoid under-doses, overdoses and drug-drug interactions, and **reduce medication errors.**

End users

Example: dabigatran

Used to treat cardio-vascular diseases

- Woman
- 55 years old
- 45 kg
- Strong renal impairment
- Normal genotype

150 mg 2/day

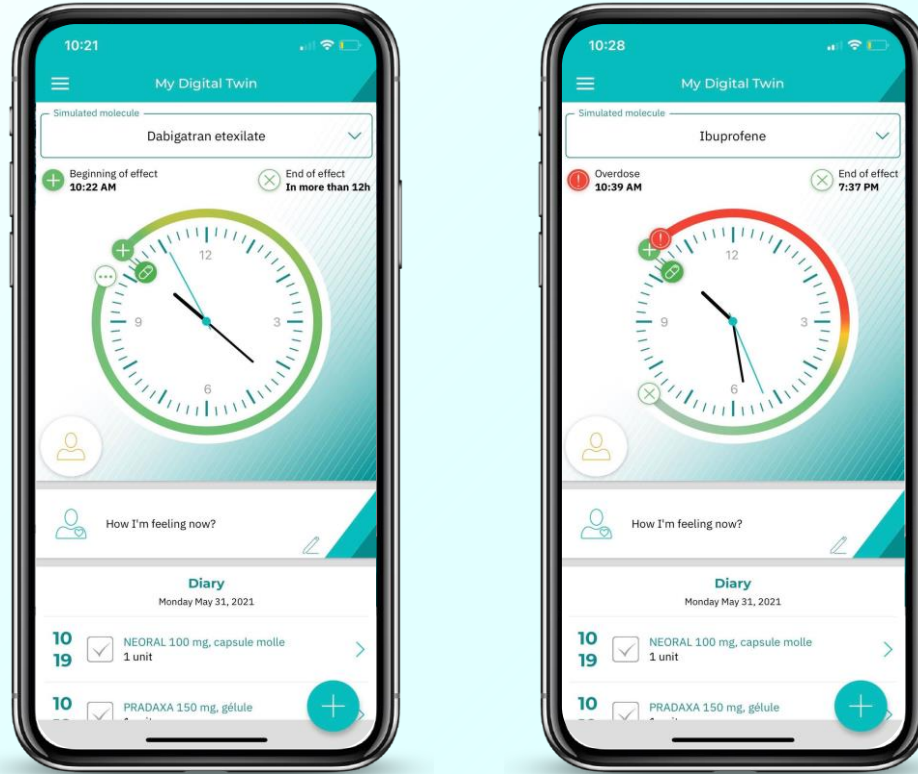

75 mg 1/day

Adapt posology to each individual patient

For Pharma's or Insurance's End Users

Avoid medication errors

- ✓ **Avoid under-doses, overdoses and drug-drug interactions**
- ✓ **History** of reported effects **correlated** to drug concentrations
- ✓ **Keep track** of treatments
- ✓ Improve **adherence**
- ✓ **Share** with Healthcare Professional
- ✓ Improve **health outcomes**
- ✓ Any additional service proposed by the third-party developing the app ...

Le Secrétaire général

Dossier suivi par Jean-Christophe DANTONEL
jean-christophe.dantonel@pm.gouv.fr
Réf : B6/JCD/n°53

Paris, le **29 MARS 2022**

Monsieur le Président,

J'ai le plaisir de vous annoncer que le Premier ministre a décidé d'attribuer une participation de France 2030, à hauteur de 1 375 823 € à votre société dans le cadre du projet OncoTwin. Ce projet s'inscrit en effet pleinement à l'appel à manifestation d'intérêt de la stratégie France 2030 « Santé Numérique ».

Bpifrance, opérateur de l'Etat pour ce programme, prendra prochainement contact avec vos équipes afin de permettre, dans les meilleurs délais, la contractualisation du financement apporté par l'Etat à ce projet.

J'appelle votre attention sur le fait que la décision du Premier ministre est assortie d'une clause de caducité et que cette contractualisation doit intervenir sous six mois, faute de quoi cette décision ne serait alors plus valide.

Je vous prie de recevoir, Monsieur le Président, l'expression de ma considération distinguée.

Bruno BONNELL

Competition : less personalization, fewer drugs

		   
Personalized PK simulations	✓	✓
Personalized PD simulations	✓	✗
Number of covariables in the models (age, weight...)	Aggregation of several models into 1 meta-model per drug -> more covariables	Only 1 ref. model per drug -> less covariables

For Pharma: Dashboard – Real World Evidence

Technology

Based on Fundamental Research with Inria

$$= \int \tilde{\phi}(c_{shared}, \tilde{c}_{specific}, \tilde{\pi}_{shared}, \tilde{\pi}_{specific}, \tilde{e}, u) d\mathbb{P}_{c_{shared}}(c_{shared}) \cdot d\mathbb{P}_{\tilde{e}}(\tilde{e}).$$

Il est naturel d'exprimer que $\tilde{\psi}_m$ doit dépendre explicitement de la matrice de covariance $\tilde{\Sigma}$ mais pas de \tilde{S} .
 $\tilde{E} \sim \mathcal{N}(0, \tilde{\Sigma})$ et $\tilde{R} \sim \mathcal{N}(0, \tilde{S})$ nous avons

$$\tilde{\psi}_m(\tilde{c}_{specific}, \tilde{\pi}_{shared}, \tilde{\pi}_{specific}, \tilde{\Sigma}, u)$$

$$= \frac{1}{(\det(\tilde{\Sigma}))^{\frac{\tilde{k}}{2}} \cdot (\det(\tilde{S}))^{\frac{\tilde{l}}{2}}} \int \tilde{\psi}(c_{shared}, \tilde{c}_{specific}, \tilde{\pi}_{shared}, \tilde{\pi}_{specific}, \tilde{e}, \tilde{r}, u) \cdot \exp\left(-\frac{\tilde{e}^t \cdot \tilde{\Sigma}^{-1} \cdot \tilde{e} + \tilde{r}^t \cdot \tilde{S}^{-1} \cdot \tilde{r}}{2}\right)$$

$$= \frac{1}{(\det(\tilde{\Sigma}))^{\frac{\tilde{k}}{2}}} \int \tilde{\psi}(c_{shared}, \tilde{c}_{specific}, \tilde{\pi}_{shared}, \tilde{\pi}_{specific}, \tilde{\Sigma}, u) \cdot \exp\left(-\frac{\tilde{e}^t \cdot \tilde{\Sigma}^{-1} \cdot \tilde{e} + \tilde{r}^t \cdot \tilde{S}^{-1} \cdot \tilde{r}}{2}\right) d\mathbb{P}_{\tilde{e}}(\tilde{e}) \cdot d\mathbb{P}_{\tilde{r}}(\tilde{r})$$

Cette réponse peut être comparée à la réponse de $C_{specific}$:

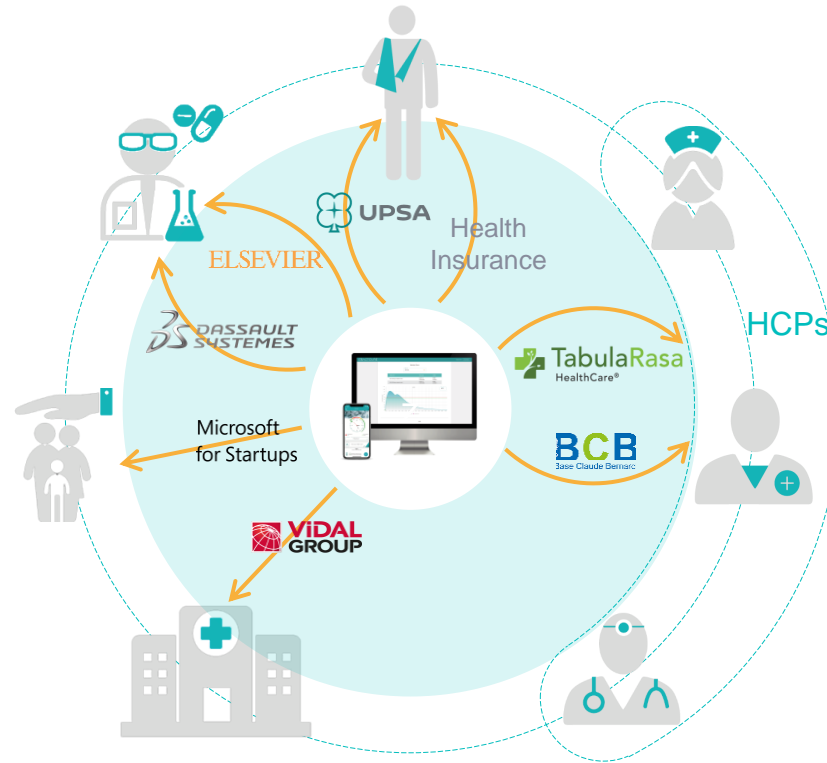

où les paramètres $\pi_{shared}, \pi_{specific}, S, \pi_{shared}, \pi_{specific}, \tilde{\Sigma}$ et \tilde{S} ont déjà été appris.

Pour conclure il suffit d'estimer les paramètres $\hat{\pi}_{specific, unknown}^{(i)}, \hat{\Sigma}_{specific, unknown}^{(i)}$. Cela passe par la minimisation de la distance J :

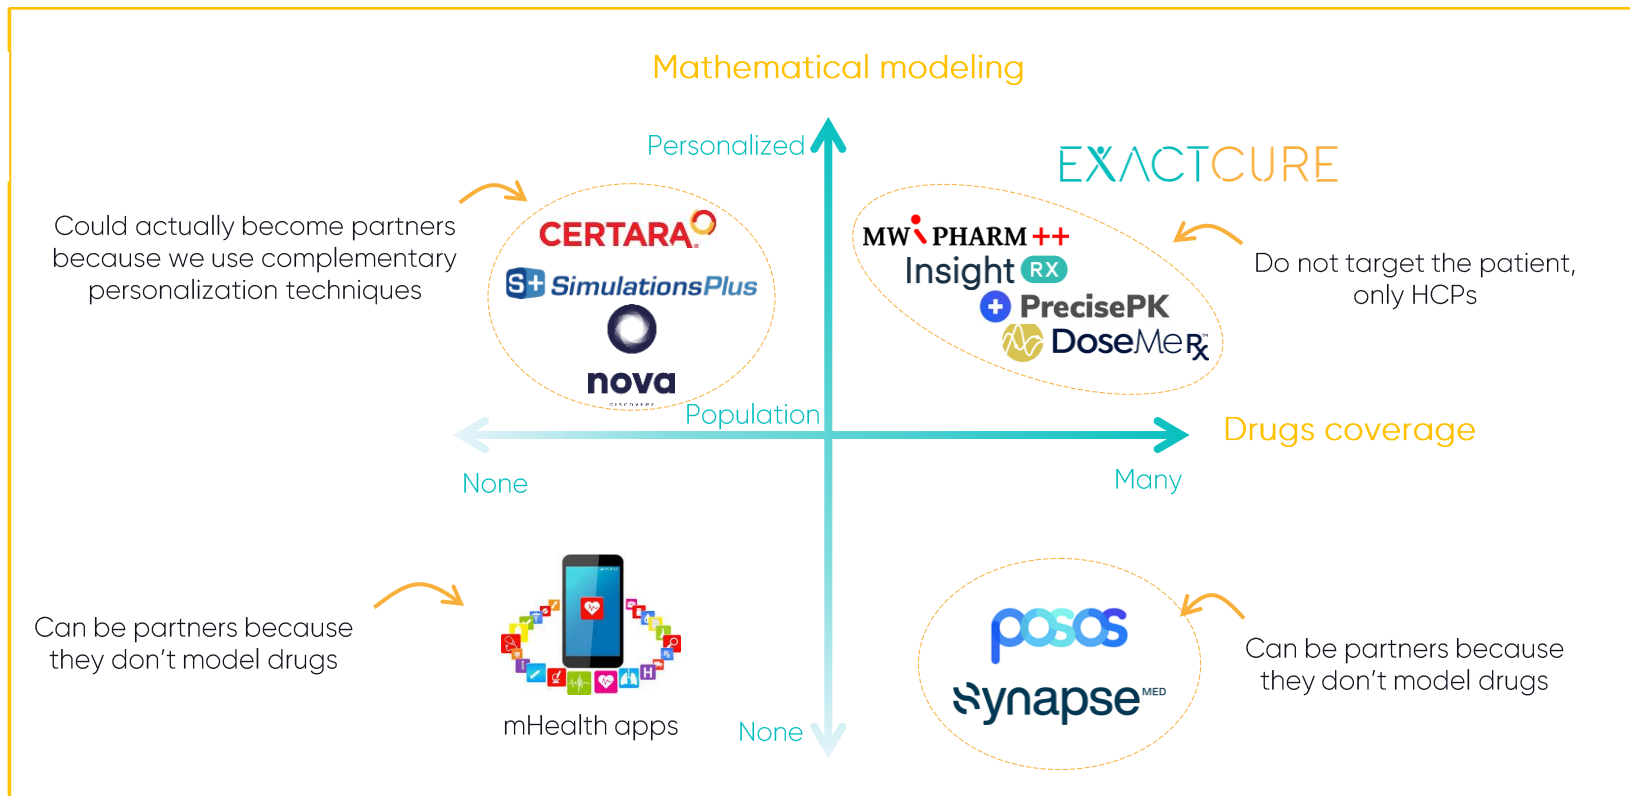

$$= \mathbb{E}(\hat{\psi}(C_{shared}, \hat{\pi}_{specific, unknown}^{(i)}, \hat{\Sigma}_{specific, unknown}^{(i)}, u)) = \arg \min(J).$$

Market Access Channels to end-users via our customers

Competition : less drugs, less personalization

US Market Segmentation + Prioritization

Ability to Compete and Size of Market

#1: Big Pharma

- + Extend reach & scope based on their needs (R&D; Commercial or safety)
- + Build credible presence in the U.S. (team & board)

Explore MDDS model to minimize regulatory burdens

#2: Foundations & Medical societies

- + Market research to identify the ones that fit the most with your track record
- + Build database conditions based on their needs (what matters to them)

#3: Health consumers

- + Clarify & accelerate the dedicated product roadmap (readiness)
- + Raise tons of funding
- + Be a specialist, partner & recommended by pharmacist (CVS > additional services ?)

MEDICATION ERRORS: WHERE DO THEY HAPPEN?

Reducing medicines-related harm requires a clear understanding of where and when errors occur. This visual summary shows the latest estimates in England per year.

DAWN CONNELLY & MARTIN COTTERELL

TYPES OF ERROR

Error rates per patient are lowest in primary care but more medicines are used, so the overall number of errors is second highest

PRESCRIBING
50.7m/21.3%

Prescribing errors are most likely to cause moderate harm (41.2% of moderate errors)

Deaths owing to definitely avoidable adverse drug reactions per year:

712

NHS costs of definitely avoidable adverse drug reactions per year:

TRANSITIONING
3.3m/1.4%

DISPENSING
37.8m/15.9%

Dispensing errors account for 17.5% of errors that have the potential to cause moderate or severe harm in primary care

MONITORING
16.5m/7.0%

MINOR: Error with little or no potential to cause harm
MODERATE: Error with potential to cause moderate harm
SEVERE: Error with potential to cause severe harm

POTENTIAL SOLUTIONS

Several strategies can be employed to reduce medicines-related harm.

- Roll out and optimise electronic prescribing and medicines administration systems

- Roll out proven interventions, such as Pincer, where pharmacists identify patients who are at risk from hazardous prescribing (see page 95)

- Improve the information available to patients to promote joint decision-making

- Use patient-friendly packaging and labelling

- Improve shared care across different settings

- Embed adequate training in safe and effective medicines use in undergraduate training and continuing professional development

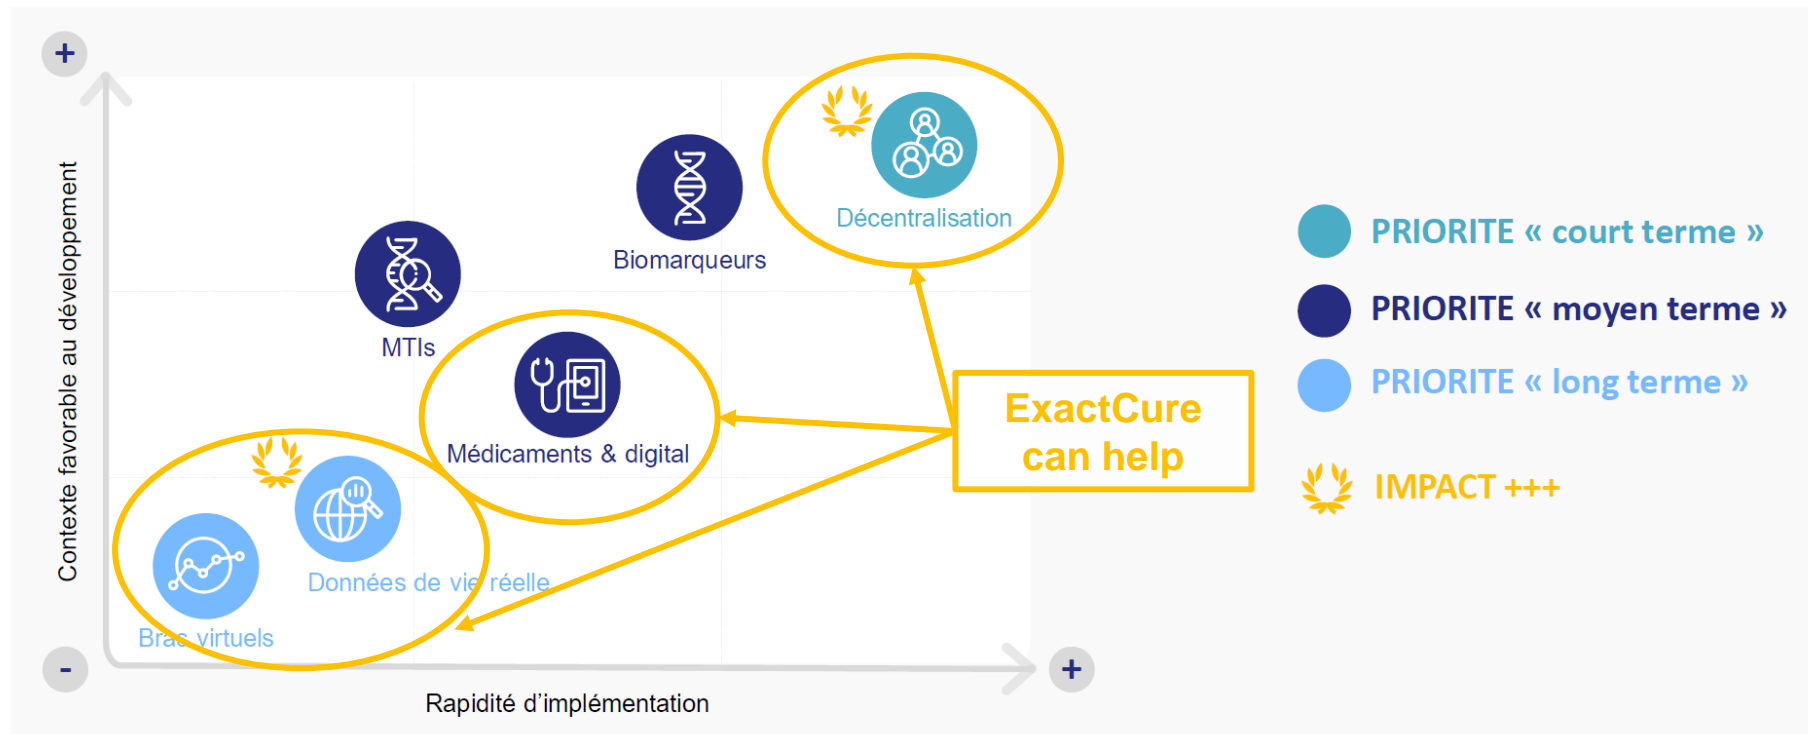

- Encourage reporting of medication errors (see page 120)

- Reduce inappropriate polypharmacy

Sources: Department of Health and Social Care, 'The report of the short life'

The World Health Organization wants to reduce severe avoidable medication-related harm globally by 50% by 2022

La décentralisation des essais cliniques = évolution prioritaire
