

ARTIFICIAL INTELLIGENCE for the ROBOTIC RECYCLING REVOLUTION

I. Market need (I). Cutting human sorters costs

- Waste sorting plants are using machinery, but in every plant there are several (up to tens) human sorters doing some operations that current machines can not do in a cost-efficient way.
- Our system can substitute their work (cost-efficiently).
- This is a dirty, dull, dangerous and non-cost efficient task → perfect to be substituted by a robot.
- The waste industry is targeting a challenging goal:

0 workers in Waste Treatment Plants

IF ROBOTS ARE GOING TO REPLACE WORKERS, THE FIRST ONES SHOULD BE HUMAN SORTERS, WHO ARE DOING A DIRTY, DULL AND DANGEROUS WORK.

2. Market need (II). Improving valuable material recovery rates

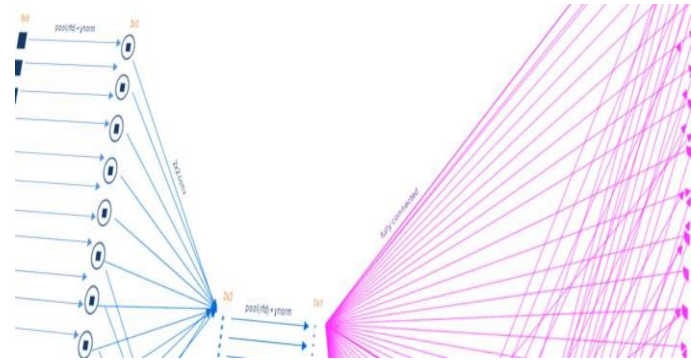

- Millions of tons of valuable materials (plastic, cans, cartons, etc) are buried or burned yearly.
- On average, only 20%* of world valuable materials present in waste are recycled or recovered.
- Why? → present practices don't allow to go further in a cost-effective way.

“For us is very important to maximize recovery of materials and energy from waste in the concept of waste as a resource in a circular economy. We know there are some materials that could be recovered (as plastics, paper, cartons, etc.) that we are not being able to recover with the current plant configuration. For this reason, initiatives technologically so innovative as the one from Sadako Technologies have been very interesting for us from the beginning and for that reason we have helped them in order to test their prototypes in a real-scale waste plant as ours.”

3. Our key competence competitive advantage: artificial intelligence

- Actually, the waste industry sorting standard for material detection is based in expensive specific cameras/sensors.
- Sadako's detection (Artificial Intelligence based) costs a fraction due to:
 - i. We use state of the art multilayer convolutional neural networks (also known as *deep learning*) artificial intelligence techniques so our system can recognize valuable materials from a standard single visual (rgb) camera.
 - ii. In situ execution is done by very simple, nearly off-the shelf computer.

- Deep learning techniques need both a very high quantity of images (big data) and huge computing power to train models. Once the models have been trained, computer-systems to perform detection can be simple (and cheap).
- We train using cloud-based computing (soft-layer by IBM) with a proprietary database of millions of labeled images.
- At plant, our Wall-B only needs a cheap standard-performance PC

4. Our 1st disruptive product: Wall-B

- Can sort valuable materials (plastics, cans and cartons) from urban waste streams with two main competitive advantages.
- Up to 1 Ton of recovery/day. Similar performance as a human sorter.

- . low-cost: using artificial intelligence for material detection.
- . non-intrusive & flexible (easy to install in an operating plant): using robotics for material collection
- . continuous working, no social security, no work absences, not lack of motivation, etc.

Wall-B will be a game changer within the global waste industry.

5. Wall-B applications

Several Wall-B can be installed in each plant (up to tens Wall-B / plant)

Two usages

→ Substituting people

↙ Cutting costs

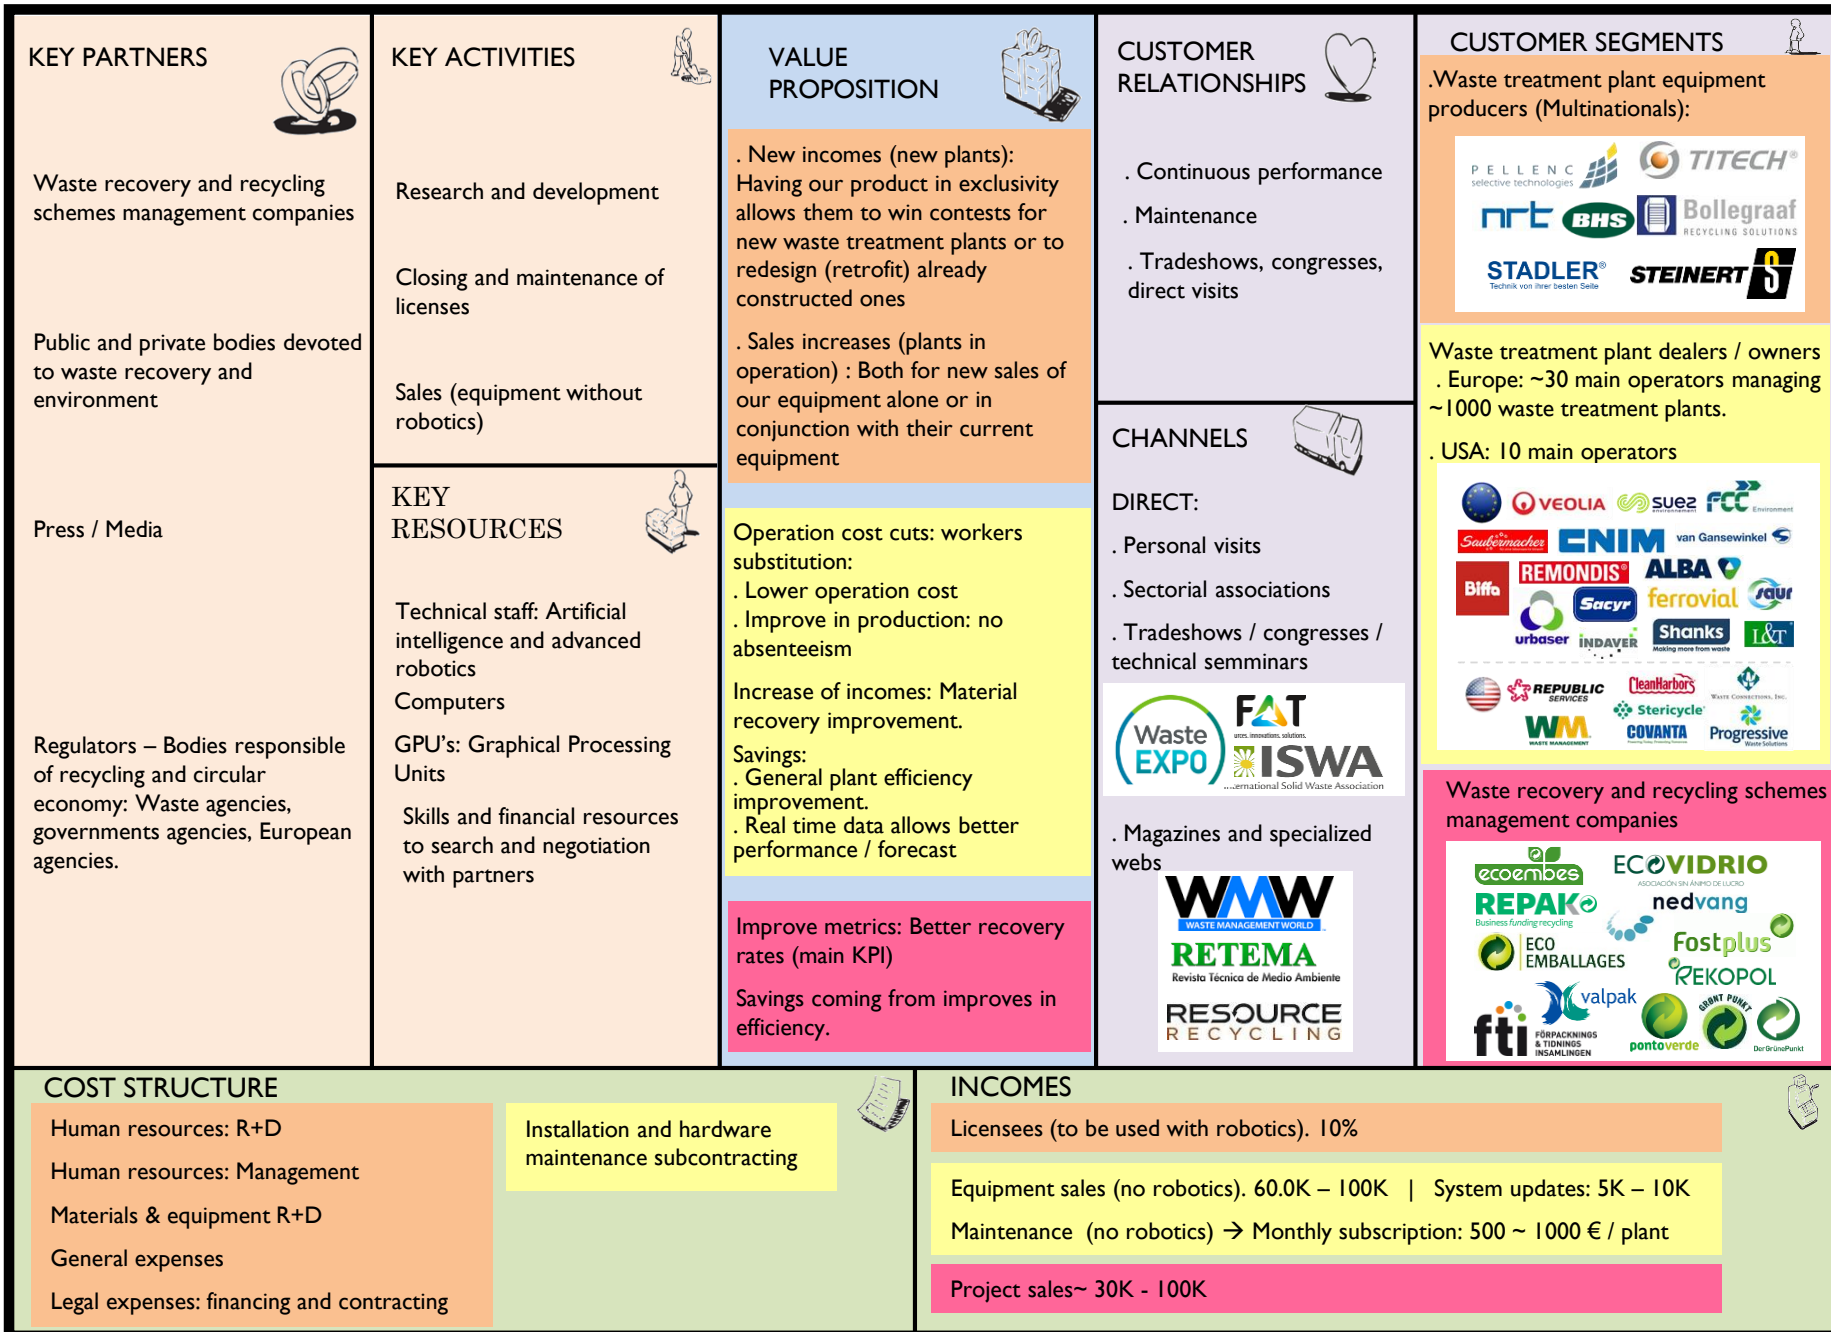

→ Recovering extra valuable materials

↗ Increasing revenues

Several Wall-B can be installed in each plant

DISRUPTION IN THE INDUSTRY

7. Waste treatment plant operators: Customers & market

This is a worldwide market, with an expected accumulated market growth in the following years of 8%*

- ✓ In Europe & USA most of the plants are already constructed, but need to improve their performance or a complete retrofitting (updating equipment).
- ✓ In under development countries plants are still to be built (and equipment to be installed).

≈ 30 operators managing
≈ 1000 waste treatment plants

Bigger operators

2020 50%

- Regulation trends will increase market needs in the near future
- According to this directive, by 2020, 50% of valuable materials in the European Union should be recuperated.

8. Competition

9. About SADAKO TECHNOLOGIES

- founded in July 2012
- 1.250K€ invested: founders (200.000€) +  + private / public loans) + industrial partner
- Main goal: Increase recycling rates from urban waste in a cost efficient way through the use of robotics and artificial intelligence
- Team of 13 people working (mainly informatics & industrial engineers)
- founders

EUGENIO GARNICA
ceo and cto

- engineer
- formerly internationals project manager in Iberdrola (IBE:Soc.Bol SIBE) engineering
- formerly, project management university teacher

JAVIER DE LA OSSA
business dev

- engineer, eMBA (IESE)
- formerly CaixaCapital Risk VC,
- formerly founder of Business Booster accelerator

BELEN GARNICA
cfo and market

- business administration, master in finances
- formerly ceo of a family business in plastic sector
- formerly consultant (finance) of startup echosystem

10. Recent Awards & acknowledgements

ARTIFICIAL INTELLIGENCE

April 2016 **Winners in the Nvidia emerging companies** contest within the GPU technology conference, San Jose, California

ROBOTICS

Sep 2015. **Selected to present in San Jose Robobusiness startup pitchfire**

WASTE

Oct 2015. **“R” Award to Best Innovation / Entrepreneurship project**

ENTREPRENEURSHIP

July 2015. **Award to Best Startup - Venture Networking Competition**

Jan 2016. **Global Robot Expo Best Robotics Startup**

SADAKO

Un robot «que ve» y separa la basura valiosa

En grandes y pequeños de una obra han cambiado entre empresas catalanas y el primer robot de reciclaje de Europa de Sadako Technologies, una startup con sede en Barcelona.

Un inicio en la industria nuclear

En el mundo de la energía nuclear, Sadako Technologies es una de las pocas empresas que ha desarrollado una solución de reciclaje de residuos nucleares. El robot de Sadako Technologies, llamado Wall-B, es capaz de separar y reciclar los residuos nucleares de la planta de Fukushima. El robot de Sadako Technologies es el primer robot de reciclaje de residuos nucleares en el mundo.

SABEMOS

Robots españoles que trabajan para gigantes del Ibex

La robótica es una industria que mueve en estos momentos más de 20.000 millones de euros en todo el mundo. Se espera que en 2020 esa cifra alcance los 80.000 millones. Muchos ceros aseguran una buena salud para un sector que salpicará a todos los demás. Un ejemplo es la startup Sadako, que ha creado un robot llamado Wall-B al que no le importa marcharse las mano de obra.

Hace unos días se celebró la feria internacional Global Robot Expo en ella se habló sobre la excelente salud de la que goza el sector de la robótica. No iba a decir lo contrario. Lógico. En el contexto de la feria se habló sobre el impacto económico que la robótica genera en la sociedad y se citó en 20.000 millones. Parece que motivos para el optimismo no faltan.

Una de las protagonistas en Global Robot Expo la startup catalana Sadako Technologies, creadora del robot separador de residuos urbanos Wall-B.

One

Este robot sabe reciclar la basura con sólo mirarla

Una empresa española logra crear la primera máquina capaz de reconocer y recoger plásticos, latas y briks entre los residuos urbanos para su posterior reciclaje.

Wall-B es el nombre de un nuevo robot diseñado por la firma catalana Sadako Technologies. La empresa, con sede en Barcelona, ha sido premiada en la Global Robot

emprenem

Belén Garnica: "El robot será una eina de productivitat per al treballador, igual que l'ordinador"

Cofundadora de Sadako Technologies, empresa de robótica

Has decidit emprendre amb el teu germà bessó Eugenio. Com va això de barrejar i negocis amb la família? Em sento còmoda amb el concepte de *start-up* familiar, encara que òbviament hi ha moments per a tot. Hem tingut camins professionals diferents, però ens hem tomat a reunir amb Sadako Technologies. Abans d'engegar-ho jo em dedicava a l'assessorament financer d'emprenedors i coneixia força aquest món. Quan l'Eugenio em proposar el projecte vaig veure que era una oportunitat per ajudar-lo. En un primer moment la nostra idea era desenvolupar un sistema de reconeixement visual de radiació nuclear,

QUO LAS 101 MENTES INNOVADORAS DE ESPAÑA

14 Doctor Joaquim Valls, matemáticas para todos

No solo es uno de los profesores de matemáticas más prestigiosos de nuestro país, también destaca como entrenador de inteligencia emocional a través del método grafotransformador. Recientemente ha publicado el libro Genial Mente, una obra polémica y revolucionaria donde defiende que cualquiera que se lo proponga es capaz de aprender matemáticas.

15 Teresa Fdez. Valdés, una de las mejores showrunners de Europa

Elegida una de las cinco showrunners (una especie de productora ejecutiva) mejores de Europa, esta joven gallega formó junto con su marido, Ramón Campos, la productora Bambú. Ha dejado su marca personal en trabajos como Hispania, Velvet, Refugiados, Gran Hotel y Gran Reserva.

16 Eugenio Garnica, hacer más eficaz el reciclaje

Garnica comenzó trabajando en el departamento de generación nuclear de Iberdrola, hasta que un día, tras haber viajado por medio mundo, apostó por dar un giro radical a su carrera. Fundó Sadako, empresa que ha visto nacer a Wall-B, un robot que hace más eficaz el reciclaje gracias a que recupera los miles de artículos con valor que día tras día se pierden en las cintas de las plantas de tratamiento.

17 Ana Bru, la primera mujer española que viajará al espacio

La agencia de Ana Bru no sólo ofrece experiencias exclusivas, sino que muy pronto podría organizarse un viaje más allá de la estratosfera. Ella será la primera mujer española que viajará al espacio gracias a Virgin Galactic. Se define a sí misma como inquieta, curiosa, emprendedora e innovadora.

Sadako Tech: "La IA se utiliza pero no de manera eficiente"

Robot able to see and sort an waste

Wall-B es un robot que separa residuos de manera eficiente. Sus creadores, la startup catalana Sadako Tech, han utilizado la **inteligencia artificial** para crear un robot que realice esta función dentro de la economía circular. Una tarea que acaba siendo pesada para el ser humano y para la que la robótica ha demostrado su utilidad.

13. Development strategy

License agreement

Under negotiation with one of the most relevant players worldwide in the waste industry.

New products pipeline

- New products to be developed, mostly under licensee agreement (adding additional incomes).
- Some examples
 - Online plant monitoring system
 - Recovered materials bales tracking system
 - Characterization system
 - Bulky sorter.

We are adding to robots the ability to understand the environment and take decisions.

Technology can be used in hundreds of applications:

- In the same field: waste.
- Other fields

14. Financials

I5. Investment round

- Amount and company value to be adjusted.
 - Amount: 500.000€.
 - Premoney: 3.500.000€
- To be used in:
 - Improve performance Wall-B
 - Development of new products within the waste sector

I 6. Final statements regarding current financial round

1. Waste treatment is and mandatory expense for any household.
2. Waste is a growing market.
3. We have a disruptive technology for this market (which will quickly become a standard).
4. Teaming with one of the global market leaders we are unleashing and impressive market potential.
5. With the necessary funding can have fast & explosive growth.

I.VISION

Given the customer reactions we envision a massive substitution of manual sorters by robots.
Being convinced that this will happen, it implies several things:

1. Soon all plants will have not one but several robots, and robots will be a standard in waste treatment plants as other equipment is now.
2. Sadako has the knowledge and the product to make it happen.
3. Others may develop that technology. The most immediate might be thinking in the current manufacturers of equipment for waste treatment plants, but they are unlikely, because their skills are another: they master more traditional technologies: hardware, service, maintenance, etc.
4. Our license agreement allows a fast commercial worldwide deployment.
